

2025 年度 Office Automation Readiness Brief

A decision-ready view of the PowerPoint, Word and Excel runtime shipped by dcc-mcp-office.

Prepared for Creative production engineering | Status **Verified showcase** | Evidence 2026-08-30

DECISION IN ONE MINUTE

Adopt the shared Office core for governed desktop automation.

The current runtime already covers editable deck generation, native document inspection, safe cross-file text replacement and validated PDF delivery. Every write remains confirmation-gated, checkpointed and independently verifiable.

Runtime capability ledger

Live handshakes advertise only the application-specific operations below; counts are evidence, not projections.

Application	Live	Provider	Verified work
PowerPoint	5	Open XML + desktop COM	Compile branded decks, inspect files, render slides, replace text and export PDF.
Word	3	Desktop COM	Inspect documents, replace body/header/footer text and export PDF.
Excel	3	Desktop COM	Inspect workbooks, replace cell text and export native PDF.

Governed execution flow

The suite treats automation as a contract: discover first, make risk visible, mutate only with authority, then prove the result.

01	Discover Handshake with the application-specific sidecar and accept only its advertised office-rpc/1 capabilities.
02	Plan Keep reusable JSON or document input separate from generated artifacts and choose the narrowest valid backend.
03	Preview Run non-destructive inspection or dry-run first, then surface the exact files, matches and risk posture.
04	Confirm Require explicit confirmation for destructive writes and capture a byte-exact checkpoint before mutation.
05	Verify Re-open outputs, validate postconditions, render previews and record a sanitized audit transcript with checksums.

Operational safeguards

Deny by default Macros, VBA, external links and arbitrary ExecuteMso paths are never silently relaxed.	Application isolation PowerPoint, Word and Excel run behind separate per-application sidecars and COM lifecycles.	Evidence over claims The gallery ships editable Office files, native exports, rendered previews, RPC transcripts and SHA-256 manifests.
--	---	---

Evidence boundary

Current evidence covers PowerPoint, Word and Excel desktop automation. Microsoft Graph and Office.js remain Phase 3; Visio, Project and Access remain future scope and are not represented as shipped capabilities.
